INFORMATION NOTE Bilgi Notu

Sanica Clear Glass

As long as water remain on glass, calcification occur on the surface of the glass and loose its transparency having dull surface. Sanica Clear Glass application creates a chemical layer on the glass surface. This layer allow water drops to slide away and prevents the dirt and scale formation. Sanica Clear Glass application Using a squeegee to clean the glass after each use protects the property for a long time.

Sanica Clear Glass

Suyun cam yüzeyinde kalması zamanla yüzeyde kireçlenmeye ve matlaşmaya neden olur. Sanica Clear Glass uygulaması cam yüzeyinde kimyasal bir tabaka oluşturur. Bu tabaka cam yüzeyinde suyun damlacıklar halinde kaymasını sağlayarak kirlilik ve kireç oluşümünün önüne geçer. Sanica Clear Glass uygulaması her kullanım sonrasında çekiç yardımıyla yüzey temizliği yapılması durumunda özelliğini uzun süre korur.

Sanica Anti Finger

The sandblasting create erosion on the glass surface. After the sandblasting process, pores occur on the surface. Sanica Antifinger application allows to create a chemical layer which cover the pores of the sandblast, thereby dirt and micro elements have no chance to cover the pores, so the surface will be protected having its original esthetic look.

Sanica Anti Finger

Kumlama desenler cam yüzeyinin aşındırılması sonucu elde edilir. Bu işlem sonrasında kumlama yapılan yüzeyde gözenekler oluşur. Sanica Antifinger uygulaması kumlama yüzeyde kimyasal bir tabaka oluşturarak gözeneklerin kapanmasını sağlar, bu sayede kirlilik ve tozun gözeneklere işlemesinin önüne geçerek estetik görüntünün muhafaza edilmesine olanak tanır.

■ After installation, the dimensions of sandblast pattern may have a negligible pinpoint shifts.
■ Kurulum yerinden kaynaklı kumlama desenlerde milimetrik kaymalar olabilir.
